CHATTERLEY-WHITFIELD COLLIERY

STAGE II SUBMISSION - COAL PREPARATION, SIDINGS  
AND LANDSALE SCHEME.

The accompanying Stage II submission outlines the expenditure and work necessary to provide a new dense medium coal preparation plant of 750,000 tons per annum capacity together with new sidings and landsale arrangements at Chatterley-Whitfield Colliery.

The submission is valued at £1,377,767, of which £1,363,346 is capital expenditure and £14,421 revenue expenditure.

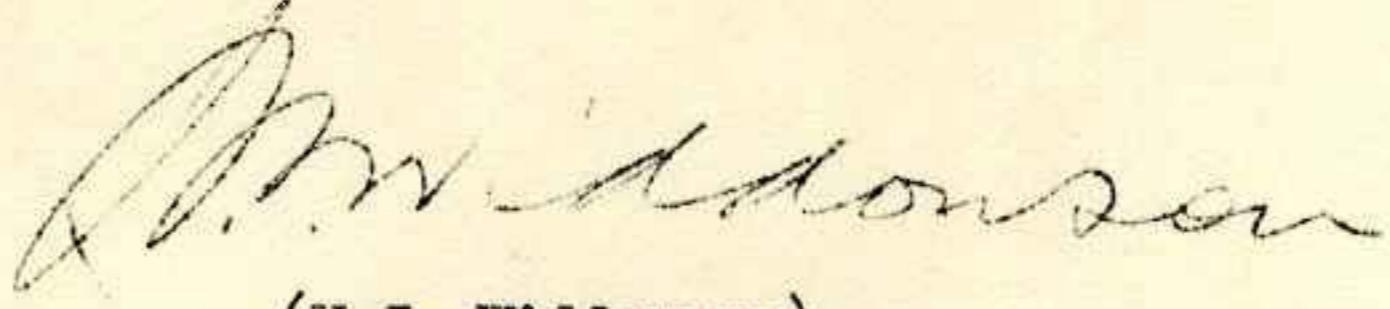

The whole scheme shows an estimated total manpower saving of 125 shifts per day, as itemised in Section 7 (Manpower) of the text.

Estimated profitability has been shown in two forms:

- 1: Appendix XVII of the application estimates that net profitability resulting solely from the introduction of new coal preparation facilities will be £123,999 per annum. This estimate of profitability has been based upon an output of 750,000 tons per annum, which is the maximum capacity of the proposed new coal preparation plant:
- 2: Appendix 'P' contains an estimate of profitability through the introduction of the whole of the works outlined in this application (coal preparation, sidings and landsale). Based on the 1960 level of output of 590,669 tons and taking interest and depreciation charges into account, profit is estimated to be £115,377 or 3/10.8d. per ton.

Liaison has been maintained with appropriate Departments at Area and Divisional level in the preparation of the details.

The Divisional Board's consideration of the submission is now requested, with a view to approval being received to enable work to commence by 1st January, 1962, for completion by 31st October, 1964.

  
(H.J. Widdowson),

CHATTERLEY-WHITFIELD COLLIERY

STAGE II SUBMISSION - COAL PREPARATION SCHEME

1): INTRODUCTION

This Stage II submission, which caters for the provision of a new dense medium coal preparation plant, associated landsale and new sidings at Chatterley-Whitfield Colliery, is valued at £1,377,767, of which £1,363,346 is capital expenditure and £14,421 is revenue expenditure (less Plant Pool Equipment valued at £18,743 capital).

Approval of the application is now requested so that arrangements may be made for the necessary orders to be placed with a view to the work being commenced by 1st January, 1962, for completion by 31st October, 1964.

The whole scheme shows an estimated total manpower saving of 125 shifts per day and, after taking interest and depreciation charges and increased proceeds into account, net profit has been estimated at £115,377 or 3/10.8d per ton, based on the same level of output as the actual 1960 result.

In the current amendment of the National Plan, Chatterley-Whitfield Colliery is scheduled to produce an output of 750,000 tons per annum, which is considerably less than the maximum output since Nationalisation which was 951,051 tons in 1947. The proposed capacity of the new coal preparation plant is 750,000 saleable tons per annum, and appendix XVII based on this tonnage indicates that the net increase in proceeds through the provision of a new coal preparation plant alone will be £123,999.

2): PREFACE

a): Location of Colliery : (Plan No.1). Chatterley-Whitfield Colliery lies in the northern part of the North Staffordshire Area and is situated adjacent to the Biddulph Valley Branch Line of British Railways and to the road from Tunstall to Congleton and Manchester. The majority of the existing railborne traffic flows via a private line which connects with the main Manchester-Stoke-London line at Longport. Good road connections are available to all the Potteries towns.

b): Objectives of scheme:

i): To provide preparation facilities to produce grades of controlled quality and of such consistency as to be suitable to the modern trend in marketing requirements. The saleable products would thereby be increased and proceeds improved.

ii): To improve landsale facilities.

iii): To increase surface manpower efficiency.

c): Main reasons for promoting scheme:

i): To replace the present inadequate preparation facilities. These have neither the performance, flexibility nor the capacity to treat the present run-of-mine output or the output scheduled to be produced in the future in a manner which would provide the optimum conditions of realisation of proceeds and satisfaction of market:

ii): To close the present private railway line and tunnel and put all colliery railborne traffic onto the Biddulph Valley Branch Line of British Railways lying immediately adjacent to the colliery:

iii): To close the outlying colliery wharves of Greenhead at Burslem and Brownhills at Tunstall and concentrate all landsale traffic at a new wharf at Chatterley-Whitfield.

d): Main technical features of the scheme:

The proposals include an entirely new coal preparation plant of 750,000 tons per annum capacity, which is the planned output of the Colliery.

The scheme will incorporate the maximum mechanical treatment, hand cleaning being limited to the +8" coal. The 8" -  $\frac{1}{2}$  m.m. raw coal will be washed by dense medium processes and the  $\frac{1}{2}$  m.m. - 0 will be treated by froth flotation. An appropriate fraction of the output from the general purpose seams will be sold untreated.

Comprehensive landsale facilities are also included in the proposals to replace the existing method of handling fuel from wagons. Two outlying wharves can then be closed.

New exchange sidings are to be constructed adjacent to the Biddulph Valley Branch Line of British Railways.

e): Cost of scheme and Estimated Return: The estimated cost of the scheme, including contingencies, is £1,377,767, of which £1,363,346 is capital expenditure and £14,421 revenue expenditure. Estimated profitability on completion of the scheme is £115,377 per annum, or 3/10.3d per ton, including depreciation and interest charges and based on the same level of output as in 1960.

3): RESERVES:

The details are shown in appendix IIIa of this submission. The colliery take is bounded to the north by the Victoria Colliery barrier; to the east there are no other collieries and the take extends to the seam outcrops (for the assessment of reserves, ordnance datum has been taken as the limit of working); to the south the boundary is comprised of barriers of Norton Colliery and the Wolstanton Concentration Scheme; and to the west the boundary is partly the Harecastle Tunnel Pillar and partly a barrier against old workings.

The basis of the calculation is to take the area in acres and multiply by the stratigraphical thickness to obtain foot acres. The figure of 1,500 tons per foot acre, less 10% allowance for small faults and losses in working, etc., is used to obtain the workable tonnage.

Total workable reserves available to the colliery at 1st January, 1961, are as follows:

	<u>000's tons</u>	
Total available above 8690' (10,000'-8690' A.D.)	22,021	Existing main locomotive horizon.
Total available between 8690'-8300' above A.D.	14,649	Future main locomotive horizon now being developed.
Total available between 8300'-6500' above A.D. (4000' deep)	73,669	
Total available between 6500'-6000' above A.D. (4000'-4500' deep)	4,254	
Total workable reserves	<u>114,593</u>	

All the seams included in the table of reserves have been proved at Chatterley-Whitfield Colliery, and all except the Ragman, Winpenny, Bricklin, Diamond and Silver seams have been worked in part. Seams being worked at the present time are Moss, Yard, Bellringer, Ten Feet, Bullhurst and Brights.

The scheme has been based on the life of the colliery being in excess of 50 years following the completion of work which is the subject of this application.

4): PRESENT POSITION

The output from the Hesketh pit plus the Yard seam from the Middle Pit is treated in the "New" screens, making Best and House coals  $+4\frac{1}{2}$ " and Best and House cobbles  $4\frac{1}{2}$ " x 3". The total 3" x  $1\frac{1}{2}$ " raw coal is washed in No.3 Greaves screen washery producing No.1 Washed House Nuts. The  $1\frac{1}{2}$ " x 0 raw coal passes by scraper conveyor to the dedusting plant where part of the feed is dedusted and the remainder passes over a dry slack extraction screen sizing at  $\frac{1}{2}$ " square. Dedusted feed and slack screen oversize is loaded into trucks for transfer to the slack washery.

The output of Bellringer coal from the Middle Pit is treated in the "Old" or "Institute" screens, making a  $+4\frac{1}{2}$ " House coal. The  $4\frac{1}{2}$ " x  $1\frac{1}{2}$ " raw coal is treated in No.4 Greaves screen washery producing  $4\frac{1}{2}$ " x 3" washed House Cobbles and 3" x  $1\frac{1}{2}$ " No.1 Washed House Nuts. The whole of the  $1\frac{1}{2}$ " x 0 raw coal passes via the dedusting plant to wagons for treatment at the slack washery.

Crushed rejects from No's 3 and 4 Greaves washboxes plus crushed hand picked inferior coal is all washed in No.5 Greaves washery producing washed No.1A mixture.

The slack washery treating dedusted  $1\frac{1}{2}$ " - 0 with a proportion of the  $-\frac{1}{2}$ " material removed is situated nearly half a mile from the raw slack loading point underneath the dedusting plant. It consists of two double unit Greaves washeries producing No.2 Washed House Nuts  $1\frac{1}{2}$ " x  $\frac{7}{8}$ ". Washed Peas  $\frac{7}{8}$ " x  $\frac{1}{2}$ " and Washed Smalls  $\frac{1}{2}$ " - 0.

The 'Old' or 'Institute' screenroom was erected about 1921 and the screens washeries were added about 1928. The slack washery commenced operation in 1922 and the "New" screenroom was added in 1934. The general condition of the coal preparation facilities are quite commensurate with their age and are totally unsuitable both in terms of efficiency and flexibility for present preparation requirements.

The primary connection to the main line for railborne traffic at Chatterley-Whitfield is via a private line of 3 miles in length with exchange sidings at Pinnox, 2 miles from the Colliery. This private line passes through a tunnel 400 yards in length which is not in satisfactory condition.

The colliery at the present time operates three landsale yards - at the colliery itself, at Brownhills (Tunstall) and at Greenhead (Burslem). To operate the private railway line and colliery sidings to serve these landsale wharves, a total of eight locomotives is employed.

The Biddulph Valley Branch Line of British Railways passes adjacent to the colliery, and although there are facilities for taking occasional wagons on this line, the traffic at present passing through this connection is negligible.

Results in recent years at Chatterley-Whitfield Colliery are as follows:

<u>Year</u>	<u>Saleable Output</u>	<u>Overall O.M.S.</u>	<u>Profit or Loss</u>
1955	663,819 tons	25.8	P. £210,863 or 6/ 4.2 per ton
1956	666,980 tons	26.1	P. 275,848 or 8/ 3.3 per ton
1957	740,587 tons	25.3	P. 21,912 or 7.1 per ton
1958	688,195 tons	23.9	P. 55,840 or 1/ 7.5 per ton
1959	686,528 tons	27.0	P. 172,897 or 5/ 0.4 per ton
1960	590,669 tons	25.2	L. 19,298 or 7.8 per ton

5): TECHNICAL PROPOSALS

The main factors affecting the design of the proposed coal preparation plant are:

a): Seams to be treated are of four types:

- i): seams of coking rank and from which the Large (+ 2") coal is of good quality (i.e. Moss):
- ii): seams of coking rank and from which the Large (+ 2") coal is of medium quality (i.e. Ten Feet, Bullhurst, Silver):
- iii): Seams of borderline coking rank with good quality large (+ 2") coal (i.e. Yard):
- iv): Seams of borderline coking rank with medium quality Large (+ 2") coal (i.e. Bellringer).

b): Winding: Seams of categories (1) and (2) will be wound up the Hesketh shaft at a maximum rate of 300 tons per hour, and those in categories (3) and (4) up the Middle Pit at a maximum rate of 120 tons per hour.

c): Treatment:

- i): Large Coal - Raw coal above 2" in size will be treated according to inherent domestic group (without regard to rank) making two qualities (Best and House) of each of the grades +8", 8" x 3", 3" x 2".
- ii): Graded coal - Raw coal from all seams 2" x  $\frac{1}{2}$ " will be control blended and washed to make Gas coal.
- iii): Small coal - Raw coal  $\frac{1}{2}$ " x 0 from coking rank seams will be washed for the preparation of coking smalls whereas  $\frac{1}{2}$ " x 0 weakly coking rank coal will be extracted dry for sale in untreated state.

Proposed New Plant: R.O.M. coal will be delivered from the Hesketh and Middle Pit shafts on separate conveyors for preliminary sizing at 2". Raw coal above 2" will be diverted into either "Best" coal or "House" coal streams as appropriate and then further screened at 8".

+8" raw coal will be hand cleaned on a rotary picking table and the 8" - 2" will be treated in a dense medium bath. +8" raw coal, 8" x 3" Cobbles and 3" x 2" Trebles from both the "Best" and "House" streams will be produced.

Each 2" - 0 raw coal stream (either coking or near-coking) will pass to a separate raw coal storage and blending bunker from beneath which the coal will be discharged at blending rates on to  $\frac{1}{2}$ " raw coal screens. The coking coal will be screened wet and the  $\frac{1}{2}$ " - 0 underflow will pass to the cyclone dense medium plant. The other stream will be screened dry and the  $\frac{1}{2}$ " - 0 undersize sold untreated.

Both 2" x  $\frac{1}{2}$ " fractions will join together for treatment in a dense medium bath which will also treat the 8" x 2" primary dense medium system rejects, the two sizes being separated by screening after treatment or treated in a split bath.

$\frac{1}{2}$ " - 0 raw coking coal flowing from the  $\frac{1}{2}$ " wet screens will pass to the cyclone plant feed sump which will also de-slime at  $\frac{1}{2}$  m.m. The  $\frac{1}{2}$ " x  $\frac{1}{2}$  m.m. coal will be treated in a dense medium cyclone plant producing clean coal, middlings and discard. The middlings from this section of the plant will join the untreated smalls whilst the clean coal will be centrifuged and passed to a small washed smalls blending hopper.

Fines below  $\frac{1}{2}$  m.m. will be treated by froth flotation and the concentrates filtered on rotary disc filters. The filter cake will then join a constant stream of  $\frac{1}{2}" \times \frac{1}{2}$  m.m. centrifuged smalls, the whole being thoroughly mixed.

Proposed landsale facilities: The proposed plant and the landsale facilities will be adjacent and integrated, the whole of the product range for landsale disposal being accommodated in receptacles designed specifically for road vehicle loading and bagging. The landsale bunkers and stallages will have a capacity equal to the daily demand of each grade.

Large coal: Hand cleaned coal of both Best and House qualities from the rotary picking table will be discharged to rail or will continue further on the table and pass to large coal bagging stallages.

8" x 3" Best or House cobbles will either pass to rail from the clean coal classifying screens or to cobbles bagging stallages fed by travelling boom loader.

Graded coal: Best or House trebles from the classifying screen will either pass to rail by boom loader or to trebles landsale bunkers, the bunkers being equipped with bagging outlets. Doubles and singles will be filled into bunkers sited such that they may be discharged either by road or rail.

Smalls: Both washed and dry smalls will be loaded to either rail or road via bunkers.

#### Dirt Disposal Arrangements:

Dirt disposal from the coal preparation plant will be by conveyor to a bunker situated on the south side of the colliery, to which dirt wound at either the Hesketh or Middle Pit shafts will also be conveyed. From this bunker the dirt will be transported by euclid to the tipping site.

#### Coal stocking and Foreign coal:

An existing coal stocking area lying immediately to the east of the Hesketh shaft will be retained. An additional coal stocking area will be made available adjacent to the coal preparation plant.

A foreign coal tippler is included in the scheme, to be capable of passing tipped fuel via road or rail to either the Best, House or General Purpose R.O.M. conveyors.

#### Proposed new sidings:

Entirely new sidings will be required for the coal preparation plant. The sidings are designed so that all the output if necessary can be loaded to wagon. Both the plant and the sidings will be designed to accommodate wagons of 24 tons capacity.

At the exchange sidings there will be six tracks, two of which will normally be reception sidings and four departure sidings.

There will be standage for just over one day's requirements of both 'Fulls' and 'Empties' wagons when the colliery is working at full capacity.

6): MARKETING

During 1960 Chatterley-Whitfield Colliery produced 590,669 saleable tons of which approximately 50% was despatched by rail and 50% by road. The majority of the railborne traffic went via the private line referred to previously. The bulk of the output was from seams of ranks 5/600 but because of high sulphur content (1.9%) only a small quantity (30,000 tons) of the washed smalls was supplied to the coking industry (all going to the Birchenwood Gas & Coke Co., at Kidsgrove). Approximately 49,000 tons of graded coal were supplied for gas making, the remainder flowing mainly to the Pottery industry, while 88,000 tons of smalls were supplied to C.E.G.B. Power Stations.

Approximately 169,000 tons of large coals in Groups 2, 4 and 5 were supplied to the domestic market locally and to the North West, while a further 41,000 tons of house coals (Group 5) were supplied for shipment to Northern Ireland.

On completion of the proposed scheme in 1964 the new plant will be capable of dealing with 750,000 saleable tons per annum and is designed to wash the 8" - 0 fraction of the output with provision for extracting untreated smalls from the Yard and Bellringer seams (Rank 701) for C.E.G.B.

From the Moss seam, the large coal +8" and Best Washed Cobbles 8" x 3" will be sold in Group 2 and the Best Washed Nuts 3" x 2" in Group 4. Provision will also be made for hand selecting +8" from the Bellringer seam for locomotive purposes. The remaining seams will be mixed and sold as House Coal +8" and washed House Cobbles 8" x 3" in Group 4, and Washed House Nuts 3" x 2" in Group 5.

The 2" x 1" and 1" x  $\frac{1}{2}$ " fraction from all seams will be mixed to produce graded coals of rank 601 which will be suitable for gas making while the washed smalls also of rank 601 will be suitable for coke ovens as their sulphur content should be reduced to 1.3%. The  $\frac{1}{2}$ " untreated smalls from the Yard and Bellringer seams will be suitable for power stations and/or Industry.

The following is a complete range of qualities to be produced from the new plant:

Grade	Size	Seams	Preparation	Tons	Group/Market
Best Coal	Over 8"	Moss	H.C.	27,000	Gp.2 Domestic
House Coal	over 8"	Yard/Bullhurst/ Silver/Ten Feet	H.C.	39,000	Gp.4 Domestic
Steam Coal	over 8"	Bellringer	H.S.	13,500	Locomotive
Best Cobbles	8" x 3"	Moss	Washed	52,500	Gp.2 Domestic
House Cobbles	8" x 3"	Yard/Bullhurst/ Bellringer/Silver/ Ten Feet	Washed	75,000	Gp.4 Domestic
Best Nuts	3" x 2"	Moss	Washed	31,500	Gp.4 Domestic/ Gas
House Nuts	3" x 2"	Yard/Bullhurst/ Bellringer/Silver/ Ten Feet	Washed	27,000	Gp.5 Domestic
Doubles	2" x 1"	All seams	Washed	95,250	Gas
Singles	1" x $\frac{1}{2}$ "	All seams	Washed	103,500	Gas
Coking Small	$\frac{1}{2}$ " - 0	Moss/Bullhurst/ Silver/Ten Feet	Washed	222,750	Coke Ovens
Dry Small	$\frac{1}{2}$ " - 0	Yard/Bellringer	Untreated	63,000	C.E.G.B/Ind.
				750,000	

Average proceeds as shown in Appendix X are estimated at 105/6.6d. per ton based on estimates of size distribution and analyses provided by Coal Preparation Department. Service Charges and wholesale margins are expected to yield a further £41,000 per annum.

On completion of the scheme the present landsale wharves at Brownhills (Tunstall) and Greenhead (Burslem) will be closed.

The comprehensive landsale facilities to be provided at the new plant, embracing part of the existing facilities at the colliery, will be capable of handling an average of 6,000 tons per week (2,000 tons per week of house coal qualities and 4,000 tons of industrial/carbonisation grades which will be supplied from bunkers fed direct from the preparation plant).

The stocking ground will be prepared to accommodate about 60,000 tons, which is sufficient to hold 4 weeks output on completion.

7): MANPOWER

Manpower employed at the present time on coal preparation, including maintenance, at Chatterley-Whitfield Colliery is 97, and it is estimated that a reduction of 27 can be effected by the introduction of new coal preparation facilities envisaged in this application. Manpower employed at the present time on landsale wharves at and associated with the colliery is 28, and it is estimated that a reduction of 24 can be effected by the closure of the two outlying wharves and the concentration of operations at the colliery. Several other minor savings in surface manpower are also envisaged in association with the whole scheme, and it is estimated that the total reduction in surface manpower will amount to 125.

Details of Manpower Saving:

	<u>Present</u>	<u>Future</u>	<u>Saving</u>
Plant operatives and maintenance	97	70	27
Landsale wharf	28	4	24
Wagon operators	32	15	17
Locomotive Drivers, Firemen and Shunters	35	14	21
Locomotive repairs	5	2	3
Platelayers	9	5	4
Banking	45	36	9
Dirt Disposal	31	11	20
TOTALS	<u>282</u>	<u>157</u>	<u>125</u>

8): ESTIMATED NEW EXPENDITURE AND INVESTMENT

Itemised in Appendix IV is the new expenditure considered necessary to complete the work. The estimated cost of coal preparation facilities has been completed by Coal Preparation Branch following consultations with Headquarters, whilst close co-operation has been maintained with all branches concerned at Colliery, Group and Area levels. As indicated in the foregoing paragraph on reserves (para. 3) the colliery has a life in excess of fifty years, consequently no provision for accelerated rates of depreciation is necessary.

Interest during the reconstruction period for the whole scheme is shown in Appendix VII, and that relating to the Coal Preparation Plant only is shown in Appendix VIIA. Total investment in the whole project amounting to Capital, £1,454,085 and Revenue £14,421 is shown in Appendix IX and the total investment in the Coal Preparation Plant only, amounting to Capital, £1,083,653 and Revenue £2,200 is shown in Appendix IXA.

9): PROFITABILITY

The expected Financial Return from the project is presented in two aspects as follows:

- a): The results expected from the operation of the new coal preparation plant are shown in Appendix XVII and are based upon planned capacity, namely 750,000 tons per annum.
- b): A statement embracing the whole new expenditure and showing the expected saving for the entire scheme, based upon the 1960 level of output is included, and is referred to as Appendix 'P'.

Appendix XVII shows that when operating at full capacity the new plant will improve "Net proceeds" by £123,999 per annum after taking depreciation and interest on Capital into account.

Appendix 'P' shows the savings expected from the surface reorganisation at the colliery. The total improvement in proceeds on the basis of existing (1960) output is estimated at £184,354 or 6/2.9d per ton. The consequent savings in manpower, due to the reorganisation, largely balance the cost of additional depreciation and interest on Capital. The net additional costs, as a result of the project, are estimated to be £68,977 or 2/4.1d. per ton. It follows that the colliery results are expected to improve by £115,377 or 3/10.8d per ton on completion of the project.

NATIONAL COAL BOARDThe Submission of Capital Projects for Approval

West Midlands Division,  
No.1 (North Staffs) Area.  
Chatterley Whitfield Colliery.  
Coal Preparation Scheme.

Surface Reorganisation - Estimate of Profitability.

Basis: 1960 Saleable Output: 590,669 tons and Current Prices.

	Annual Amount £
<b>A. IMPROVEMENT IN PROCEEDS</b>	
1. Increase in proceeds that will result in same seam content being processed in New Plant (per Appendix XVII 99/11.4d to 105/6.6d.)	
590,669 tons @ 5/7.2d. =	165,387
2. Additional Saleable Output available as a result of reducing Discard from 15.5% to 15%. (per Appendix XVII)	
15.5% of 718,676 tons = 111,395	
15% of 718,676 tons = <u>107,801</u>	
Additional Tonnage = 3,594 @ 105/6.6d	<u>18,967</u>
Total Improvement in Proceeds	£ 184,354
<b>B. SAVINGS AS A RESULT OF REORGANISATION</b>	
1. Reduction in manpower (282 - 157) = 125 Men	
<u>Wages</u>	
125 x 5 shifts x 49 weeks x 43/- (Current Surface E.M.S.) = 65,844	
ADD 20% for Wages Charges	<u>13,169</u>
	79,013
2. Elimination of the need to transport 1½" - 0" size from screens to Slack Washery.	
Cost in 1960	<u>10,157</u>
Total Saving	£ 89,170
<b>C. ADDITIONAL COSTS AS A RESULT OF REORGANISATION</b>	
1. Increased Cost of Coal Preparation Materials Estimate on Completion adjusted to current output.	
Viz: £10,980 x $\frac{600}{750}$ = 8,784	
LESS 1960 Actual Cost = <u>6,320</u>	2,464
2. Increase in Power, Heat & Light, Coal Preparation Plant. Estimate on Completion adjusted to current output.	
Viz: £19,650 x $\frac{600}{750}$ = 15,720	
LESS 1960 Actual Cost = <u>5,266</u>	10,454
	C/fwd. 12,918

APPENDIX P. Sheet 2/2

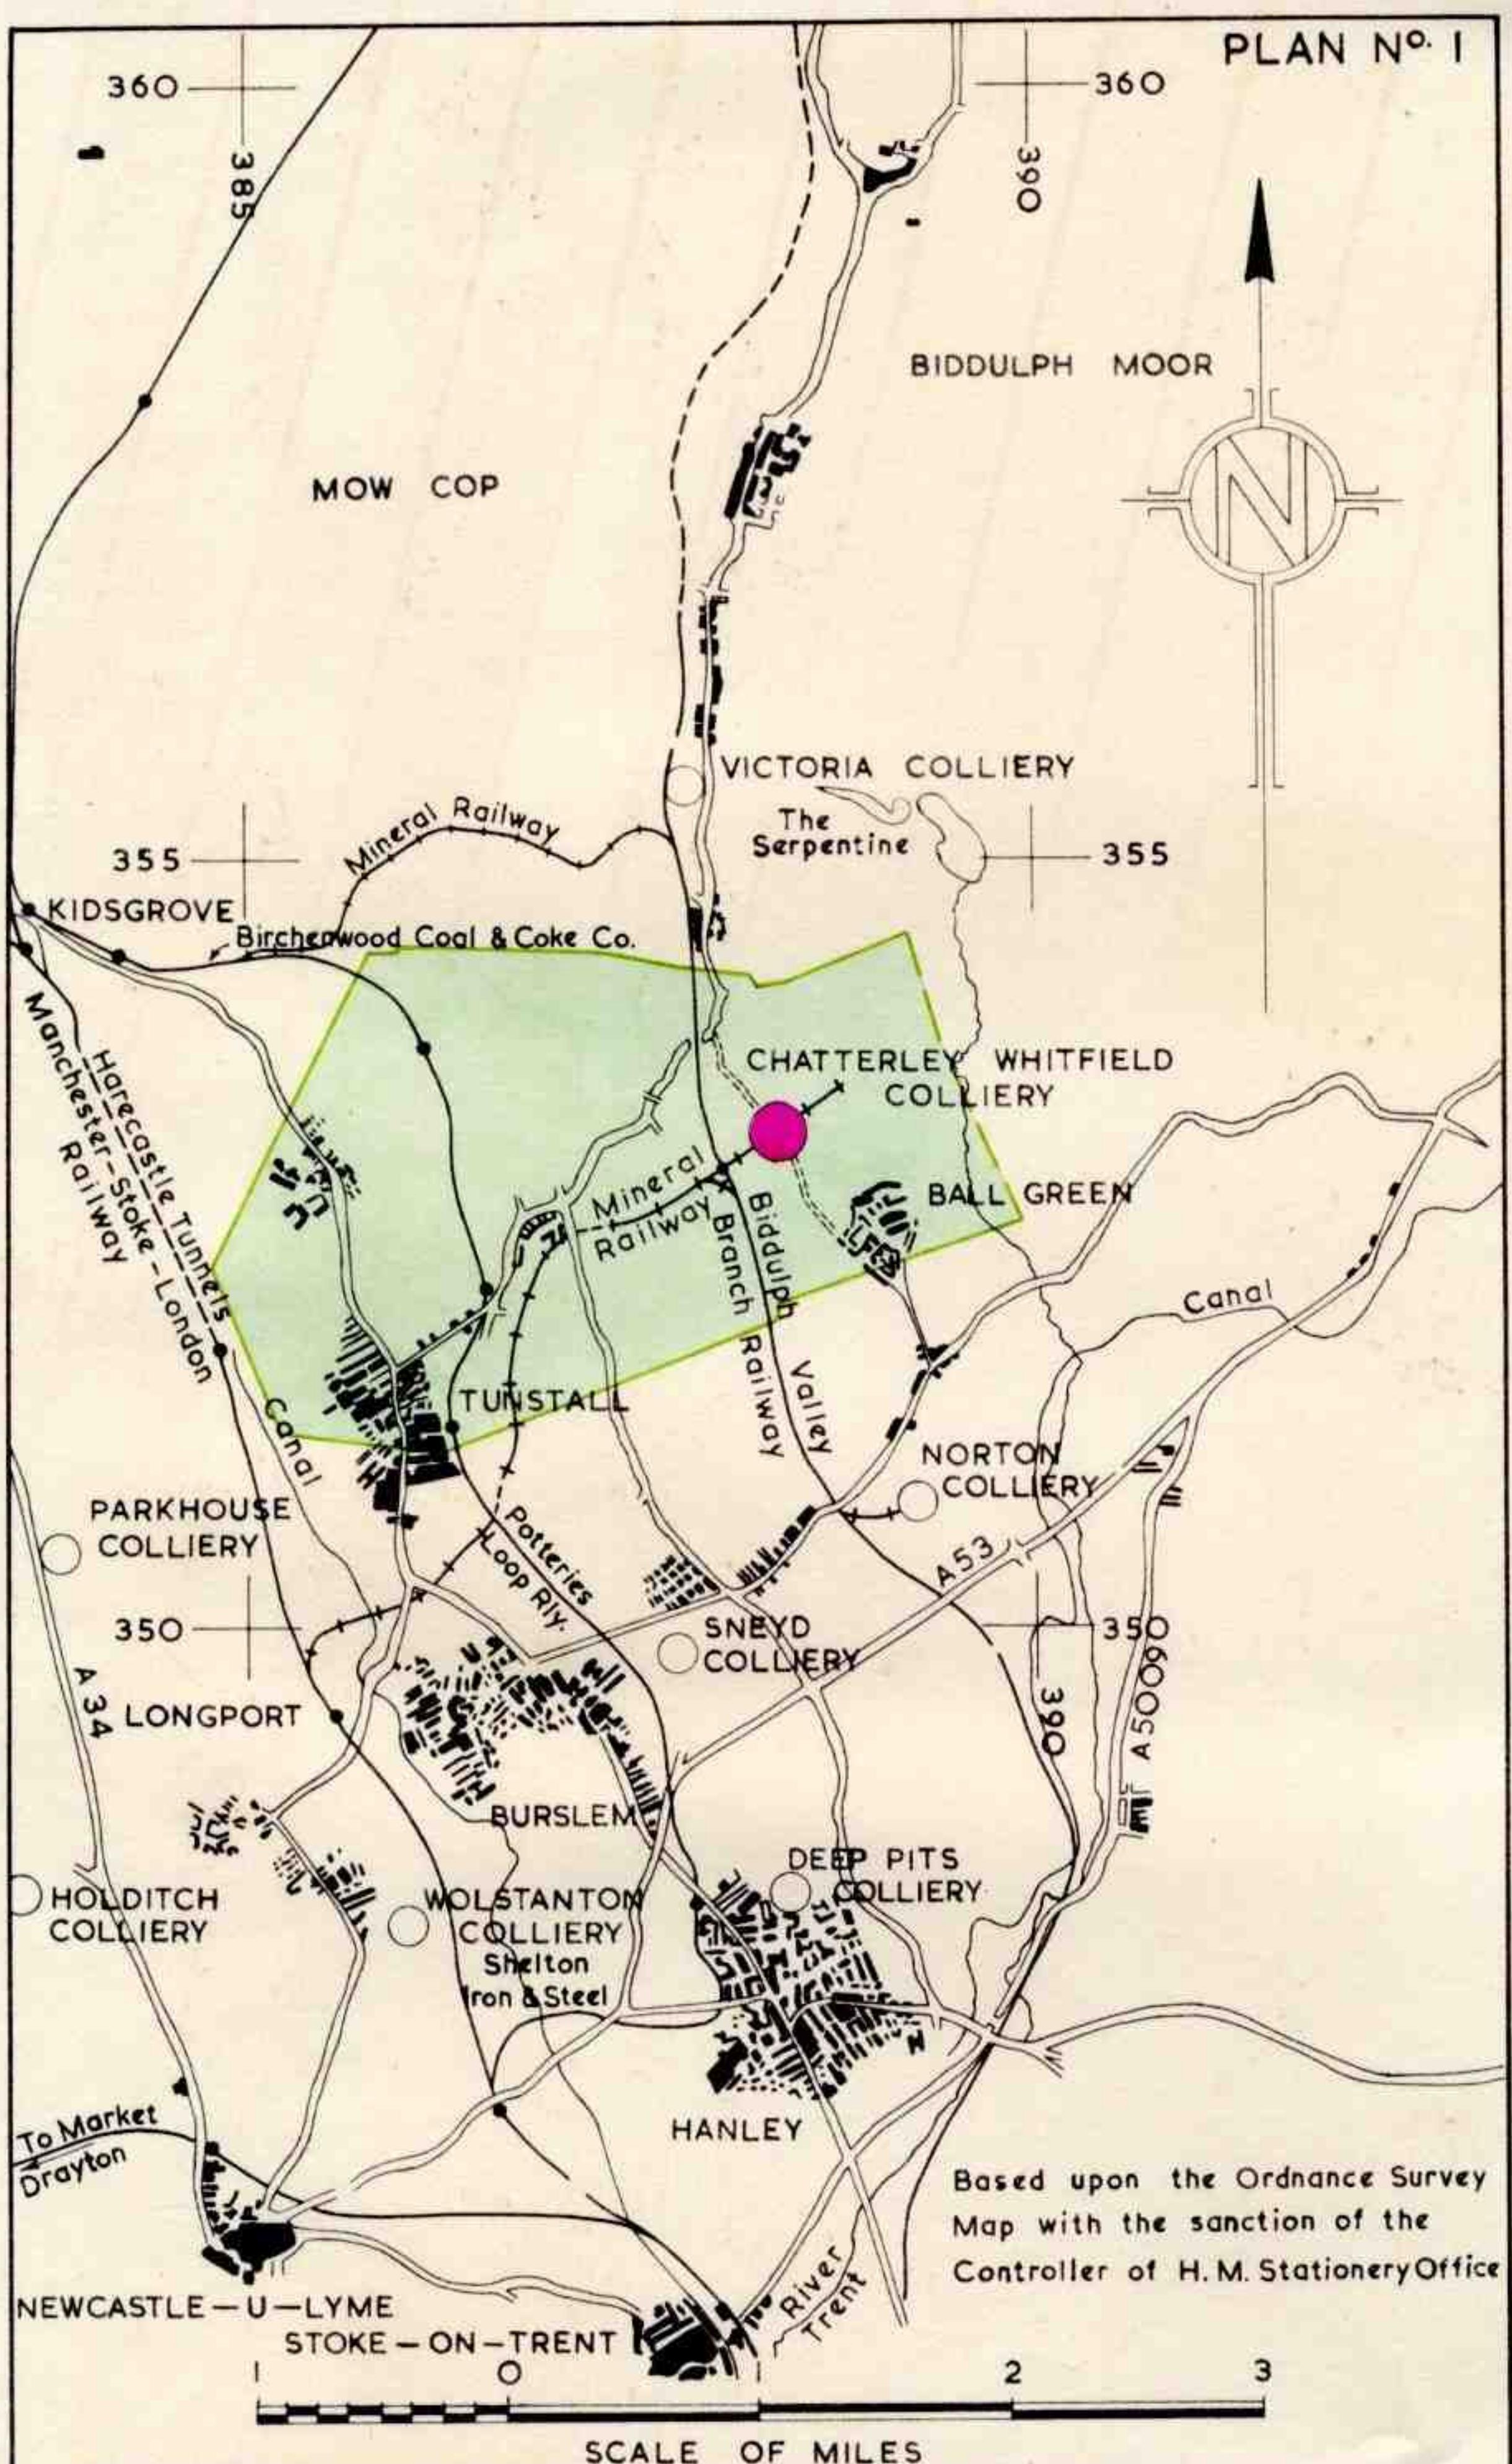

C.	continued.....		12,918
3.	Depreciation on New Expenditure. As per Estimate in Appendix IV		55,262
4.	Interest on Additional Capital Investment. (Appendix IX)		
	6% on £1,454,085	= 87,245	
	Amortisation of Capitalised Interest at 3% (see Appendix VII)	= <u>2,722</u>	89,967
			<hr/>
		Total Additional Costs	£ 158,147
			<u>=====</u>
D.	<u>SUMMARY OF B &amp; C</u>	Annual <u>Amount</u>	<u>Per Ton</u> <u>s. d.</u>
	Additional Costs, including Depreciation and Interest.	158,147	5 4.3
	<u>LESS</u> Savings in Wages & Transport	<u>89,170</u>	<u>3 0.2</u>
	NET ADDITIONAL COSTS AS A RESULT OF THE SCHEME.	£ 68,977	2 4.1
		<u>=====</u>	<u>=====</u>
E.	<u>PROFITABILITY</u>		
	Improvement in Proceeds (para. A)	184,354	6 2.9
	<u>LESS</u> Net Additional Costs (para. D)	<u>68,977</u>	<u>2 4.1</u>
	Additional Profitability	£ 115,377	3 10.8
		<u>=====</u>	<u>=====</u>

Yield on Capital Invested      7.93%

Item No.	Description of Item.
1	R.O.M. Conveyor. Best Coal - Hesketh Pit.
2	R.O.M. Conveyor. House Coal - Hesketh Pit.
3	R.O.M. Conveyor. Either grade - Middle Pit.
4	Primary Raw Coal Screen "2" Best - Hesketh.
5	Primary Raw Coal Screen "2" House - Hesketh.
6	Primary Raw Coal Screen "2" Either grade - Middle.
7	Secondary R.C. Screen "8" Best.
8	Secondary R.C. Screen "8" House.
9	Inner Picking Table Best.
10	Outer Picking Table House.
11	Picked Dirt Conveyor.
12	Inferior Coal Conveyor.
13	Inferior Coal Crusher.
14	Crushed Middlings Conveyors.
15	" Large Best" Wagon Loading Boom.
16	" Large Best" Landsale Stallage Feed Conveyor.
17	" Large House" Wagon Loading Boom.
18	" Large House" Landsale Stallage Feed Conveyor.
19	8"- 2" Best Coal Primary D.M. Bath.
20	8"- 2" House Coal Primary D.M. Bath.
21	8"- 2" Landsale C.C. Classifying Screen Best.
22	8"- 2" Landsale C.C. Classifying Screen House.
23	8"- 2" C.C. Conveyor Best.
24	8"- 2" C.C. Conveyor House.
25	8"- 2" C.C. Classifying Screen Best
26	8"- 2" C.C. Classifying Screen House
27	Best Cobbles Wagon Loading Boom.
28	House Cobbles Wagon Loading Boom.
29	Best Trebles Wagon Loading Boom.
30	House Trebles Wagon Loading Boom.
31	Best Cobbles Landsale Stallage Feed Conveyor.
32	House Cobbles Landsale Stallage Feed Conveyor.
33	Best Trebles Landsale Bunker Feed Conveyor.
34	House Trebles Landsale Bunker Feed Conveyor.
35	Best Trebles Landsale Bunker.
36	House Trebles Landsale Bunker.
37	2"- 0 Coking Coal Conveyor.
38	2"- 0 G.P. Coal Conveyor.
39	2"- 0 Coking Coal Storage & Blending Bunker.
40	2"- 0 G.P. Coal Storage & Blending Bunker.
41	Tertiary Raw Coal Wet Screen $\frac{1}{2}$ " Coking Coal.
42	Tertiary Raw Coal Dry Screen $\frac{1}{2}$ " G.P. Coal.
